MEDIAN FARE

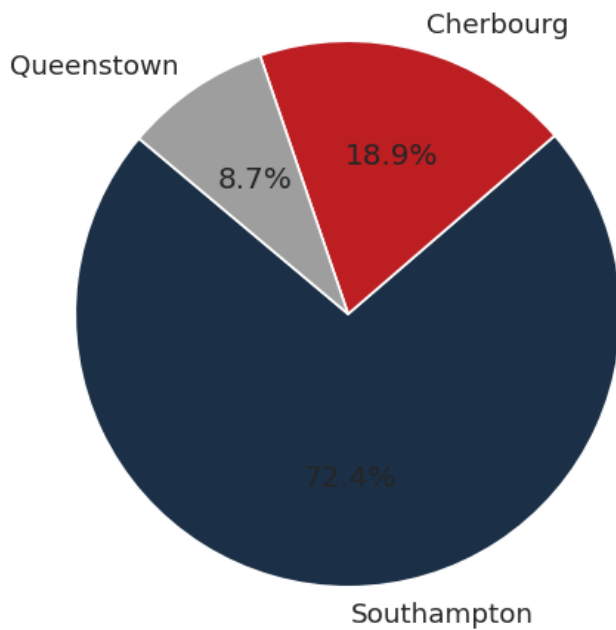

1. THE FAMILY INFLUENCE

Data suggests that being completely alone was dangerous. Passengers traveling with 2-4 family members had the **highest survival rates**.

Insight: Very large families (over 5 members) saw a sharp decline in survival, likely due to the difficulty of keeping large groups together during the panic.

Passenger Distribution by Port of Origin

2. ORIGIN & GEOGRAPHY

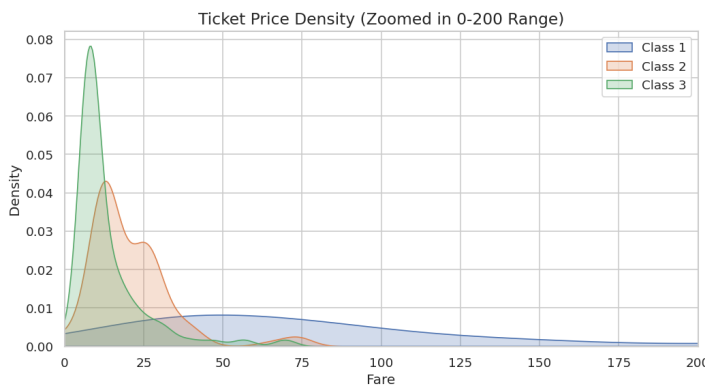

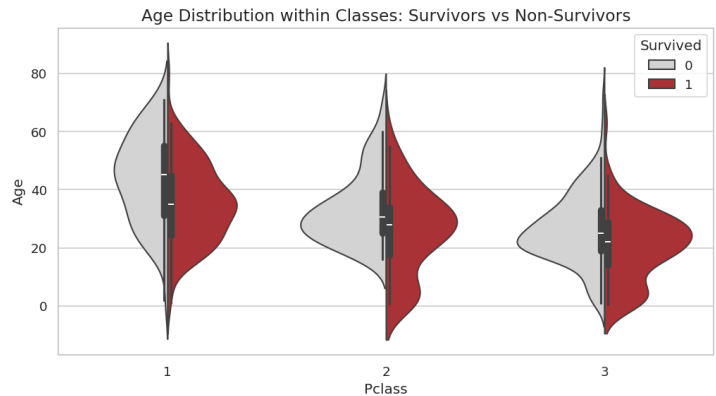

The majority of passengers (72.3%) boarded at **Southampton**. However, passengers from **Cherbourg** showed higher average survival rates, correlating with the fact that more of them were in 1st Class.

3. AGE WITHIN SOCIAL CLASSES

This "Violin" chart shows where the most survivors were located across ages. The wider the shape, the more people in that age group.

- **Red Shapes:** Survivors
- **Grey Shapes:** Non-Survivors

Notice the spike in 1st class (Class 1) for children; almost all young children in the top class were saved.

4. THE ECONOMICS OF THE TICKET

Each curve represents a ticket class. The 3rd class (green) is heavily stacked at the very low end (under \$20). The 1st class (blue) is much flatter, showing that some "premium" tickets were extremely expensive compared to the ship's average.

5. SOCIAL HIERARCHY & TITLES

By extracting titles from names, we can see the social structure. "Mr." was the most prevalent, but passengers with "noble" titles or professional ones (like Dr. or Col.) often had different survival outcomes.
